RISE Crash Course: "Practical Basics of LLMs over APIs"

Sorin Marti, Lea Kasper (RISE & EIB), 16.10.2024

Who is Research and Infrastructure Support (RISE)?

“We support researchers in the humanities and social sciences at the University of Basel in the conception of computer-based research, the creation, analysis and user-oriented presentation of digital data, as well as in sustainable and open methods of data dissemination.”

Agenda

1. Prepare

- a. Conceptualize a workflow
- b. Test your prompt and source material
- c. Choose a Provider, Get API Access
- d. Manage/Calculate Cost

- What data will be processed how in which steps?
- Does it work in a browser?
- Which provider is best for your needs?
- How can you limit and control costs?

2. Use the APIs

- a. Write requests and pass context
- b. Extended options/features

- How to write a simple python script which does X requests?
- How do I set token limits, temperature, etc.?

3. Save output for further use

- a. Output formatting
- b. Saving to data structures

- How do I tell the LLM to format output data?
- How to save the LLMs outputs to files?

4. Discussion

Course Materials

- All examples, scripts and the slides are available in a GitHub repository and over Zenodo.
- There is a step-by-step tutorial on how to try the example by yourself or adapt it for your own research.
- You will have to create your own API keys in order to use the examples. Be aware that all prices and ratios mentioned in this presentation are changing constantly.

Agenda

1. Prepare

- a. **Conceptualize a workflow**
- b. Test your prompt and source material
- c. Choose a Provider, Get API Access
- d. Manage/Calculate Cost

→ **What data will be processed how in which steps?**

→ Does it work in a browser?

→ Which provider is best for your needs?

→ How can you limit and control costs?

2. Use the APIs

- a. Write requests and pass context
- b. Extended options/features

→ How to write a simple python script which does X requests?

→ How do I set token limits, temperature, etc.?

3. Save output for further use

- a. Output formatting
- b. Saving to data structures

→ How do I tell the LLM to format output data?

→ How to save the LLMs outputs to files?

4. Discussion

Example Data

- Source: *Index of Swiss agents representing United Kingdom firms / British Chamber of Commerce for Switzerland*
- 197 images. Some of them are not part of the lists.
There are advertisements and an introduction.
- Well formatted list-entries in three sections: A,B,C.
A: British Firms, B: Swiss Firms, C: Goods Categories
- Last part of line: connections to other firms or goods categories

Conceptualize a Workflow

- What data do you have?

“197 jpg images of a printed book. They contain lists of members of a chamber of commerce. The book is in English, it is from 1951”.

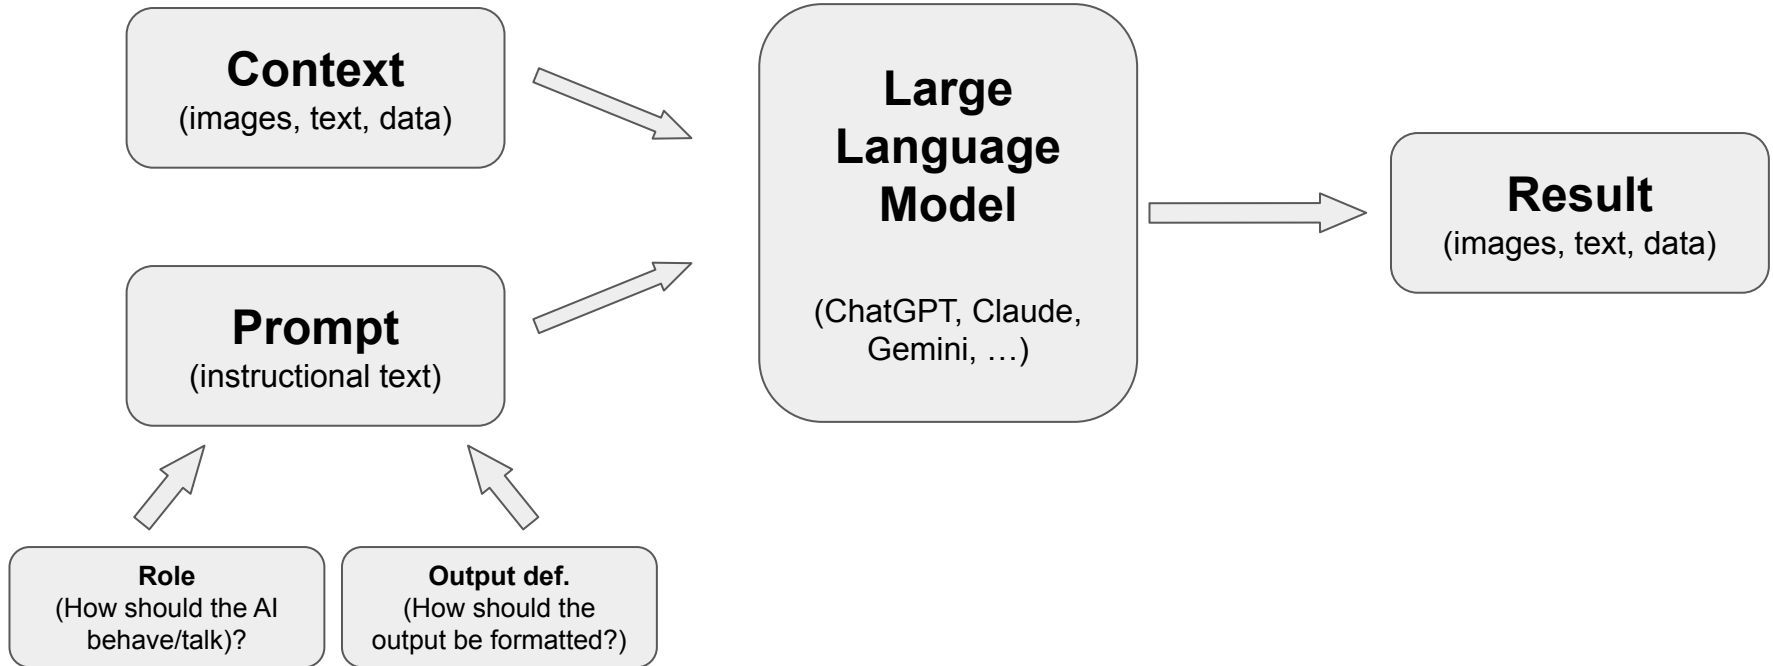

- What information do you want to extract from this data?

“Company names, Location names, Network information.”

- How should a response be structured?

“A list of standardized JSON entries to create networks from.”

Parts of an LLM request

Example LLM request

Revisit the Workflow: Tasks

- Download all the images from e-manuscripta
- Sort out images which are not part of the list
- Engineer a prompt to extract the needed information
- For each valid image:
 - Send a request to an LLM with the image as context
 - Save the response in a meaningful way
- Merge all the information into a dataset
- Random sampling to assure accuracy

Agenda

1. Prepare

- a. Conceptualize a workflow
- b. Test your prompt and source material**
- c. Choose a Provider, Get API Access
- d. Manage/Calculate Cost

→ What data will be processed how in which steps?

→ **Does it work in a browser?**

→ Which provider is best for your needs?

→ How can you limit and control costs?

2. Use the APIs

- a. Write requests and pass context
- b. Extended options/features

→ How to write a simple python script which does X requests?

→ How do I set token limits, temperature, etc.?

3. Save output for further use

- a. Output formatting
- b. Saving to data structures

→ How do I tell the LLM to output data?

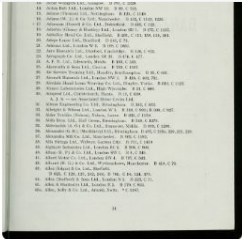

→ How to save the LLMs outputs to files?

4. Discussion

Test in Browser: ChatGPT

- Present one single image and explain the task, i.e. design the prompt.
- This lets you work on your prompt and test results.
- Good prompt engineering is crucial!
- You might experience character limit issues. The API can deal with that.

ChatGPT 4o, 06.10.24

You are a machine and your answer is a formatted JSON list. I present you an image and want you to extract every item in the list on the image. This is section A. Each list item belongs to a section and the line has the following structure: [number], [company], [location], [connections]. The last part is a comma-separated list to other sections. They are formatted like this "[section] [number]". Please return a json list of the complete page in the described structure.

Here is the structured JSON list extracted from the image:

```
json
[
  {
    "number": 1,
    "company": "Abbott, Anderson & Abbott Ltd.",
    "location": "Harpden, Herts.",
    "connections": ["B 203", "C 602"]
  },
  {
    "number": 2,
    "company": "Abdulla & Co. Ltd.",
    "location": "London E 1.",
    "connections": ["B 515", "C 1446"]
  },
  {
    "number": 3,
    "company": "Aberdare Cables Ltd."
  }
]
```

Test in Browser: Claude

- Present one single image and explain the task, i.e. design the prompt.
- This lets you work on your prompt and test results.
- Good prompt engineering is crucial!
- You might experience character limit issues. The API can deal with that.

Claude 3.5 Sonnet, 06.10.24

Untitled ▾

SM You are a machine and your answer is a formatted JSON list. I present you an image and want you to extract every item in the list on the image. This is section A. Each list item belongs to a section and the line has the following structure: [number]. [company], [location],[connections]. The last part is a comma,separated list to other sections. They are formatted like this "[section] [number]". Please return a json list of the complete page in the described structure.

I understand you want me to extract the information from the image and return it as a formatted JSON list. I'll process the content and provide the result in the requested structure. Here's the JSON list based on the image:

```
json
[
  {
    "section": "A",
    "items": [
      {
        "number": 1,
        "company": "Abbott, Anderson & Abbott Ltd.",
        "location": "Harpenden, Herts.",
        "connections": ["B 203", "C 602"]
      },
      {
        "number": 2,
        "company": "Abdulla & Co. Ltd.",
        "location": "London E 1.",
        "connections": ["B 515", "C 1446"]
      }
    ]
  }
]
```

Test in Browser: Gemini

- Present one single image and explain the task, i.e. design the prompt.
- This lets you work on your prompt and test results.
- Good prompt engineering is crucial!
- You might experience character limit issues. The API can deal with that.

Gemini 1.5 Flash, 06.10.24

S You are a machine and your answer is a formatted JSON list. I present you an image and want you to extract every item in the list on the image. This is section A. → How to write a simple python script which does X requests?

→ How do I set token limits, temperature, etc.?

3. Save output for further use

- a. Output formatting
- b. Saving to data structures

→ How do I tell the LLM to format output data?

→ How to save the LLMs outputs to files?

4. Discussion

Manage and Calculate Cost

- Costs are calculated based on the input tokens, output tokens and the models used.
- Each provider has its own pricing model; they change often.
- Most providers have general limits (monthly limit, pay as you go, ...)
- Tokens?
 - Smaller units of text, that may be words, parts of words, or even punctuation.
 - Rough estimate: 1 token \approx 4 characters (including spaces; in english language)

Manage and Calculate Cost

- Input Tokens (What is sent to the LLM?)
 - Prompt → 1200 chars / 4 \approx 300 Tokens
 - Number of Tokens for the image → (1'024 px * 1'492 px)/750 \approx 2'037 Tokens
 - Total input tokens → 300 + 2'037 = **2'337 Tokens**
- Output Tokens (What is received from the LLM?)
 - Expected length of output → ~45 lines * 400 chars. \approx **4'500 Tokens**
- Total Cost:
 - ~ 200 * 2'337 Input Tokens → ~467'400 Tokens
 - ~ 200 * 4'500 Output Tokens → ~900'000 Tokens

Manage and Calculate Cost

- GPT-4o

<https://openai.com/api/pricing/>

- \$2.50 / 1M Input Tokens

→ ~467'400 Tokens = \$ 1.17

- \$10 / 1M Output Tokens

→ ~900'000 Tokens = \$ 9.00 **\$10.17**

- 3.5 Sonnet

<https://www.anthropic.com/pricing#anthropic-api>

- \$3 / 1M Input Tokens

→ ~467'400 Tokens = \$ 1.40

- \$15 / 1M Output Tokens

→ ~900'000 Tokens = \$13.50 **\$14.90**

- Gemini 1.5 Pro:

<https://ai.google.dev/pricing>

- \$1.25 / 1M Input Tokens

→ ~467'400 Tokens = \$ 0.58

- \$5 / 1M Output Tokens

→ ~900'000 Tokens = \$ 4.50 **\$5.09**

Agenda

1. Prepare

- a. Conceptualize a workflow
- b. Test your prompt and source material
- c. Choose a Provider, Get API Access
- d. Manage/Calculate Cost

- What data will be processed how in which steps?
- Does it work in a browser?
- Which provider is best for your needs?
- How can you limit and control costs?

2. Use the APIs

- a. **Write requests and pass context**
- b. Extended options/features

- **How to write a simple python script which does X requests?**
- How do I set token limits, temperature, etc.?

3. Save output for further use

- a. Output formatting
- b. Saving to data structures

- How do I tell the LLM to format output data?
- How to save the LLMs outputs to files?

4. Discussion

Create A Script: Use existing libraries

The image displays three overlapping screenshots of Python Package Index (PyPI) library pages. The top-left screenshot shows the 'openai 1.51.0' page, featuring a blue header with the version number, a 'pip install openai' button, and a description: 'The official Python library for the openai API'. The top-right screenshot shows the 'google-generativeai 0.8.2' page, with a blue header, a 'pip install google-generativeai' button, and a description: 'Google Generative AI High level API client library and tools.'. The bottom-center screenshot shows the 'anthropic 0.35.0' page, with a blue header, a 'pip install anthropic' button, and a description: 'The official Python library for the anthropic API'. This screenshot also includes a navigation sidebar with links to 'Project description', 'Release history', and 'Download files', and a 'Project description' section titled 'Anthropic Python API library'. At the bottom of the anthropic page, it lists supported Python versions (3.9, 3.10, 3.11, 3.12) and shows a download rate of 35k/day.

openai 1.51.0

```
pip install openai
```

python 3.9 | 3.10 | 3.11 | 3.12

downloads 35k/day

Create A Script: They all work alike

```
api_key = "4-v3ry-10ng-4nd-s3cr3t-4p1-k3y"  
prompt = "[...]"
```

```
from openai import OpenAI  
  
client = OpenAI(api_key=api_key)  
  
workload = [...]  
  
answer = client.chat.completions.\  
    create(  
        messages=workload,  
        model="gpt-4o")  
  
text =  
    answer.choices[0].message.content
```

```
from anthropic import Anthropic  
  
client = Anthropic(api_key=api_key)  
  
answer = client.messages.create(  
    max_tokens=2048,  
    messages=[  
        {"role": "user",  
         "content": prompt,  
        }],  
    model="claude-3-opus")  
  
text = answer.content[0].text
```

```
import google.generativeai as genai  
  
genai.configure(api_key=api_key)  
model = genai.GenerativeModel\  
    ("gemini-flash1.5")  
  
answer = model.generate_content\  
    ([prompt])  
  
text = answer.text
```

Create A Script

```
from openai import OpenAI
from variables import prompt, base64_image

client = OpenAI(api_key="sk-proj-R-wLk...xyz")

workload = [
    {
        "role": "user",
        "content": [
            {"type": "text", "text": prompt},
            {"type": "image_url", "image_url": {"url": f"data:image/jpeg;base64,{base64_image}"}}
        ]
    },
    {
        "role": "system",
        "content": "You are a precise list-reading machine and your answers are plain JSON."
    }
]

answer = client.chat.completions.create(messages=workload,
                                         model="gpt-4o",
                                         temperature=0.5)
```

Add additional data to your prompt

- Add metadata such as the page number or a page id.

```
page_number = 1
for root, _, filenames in os.walk("image_data"):
    for filename in filenames:
        if filename.endswith(".jpg"):
            image_id = filename.split(".")[0]
            prompt = "[...]. The id of the image is {image_id} and the page number is {page_number}."

            # Do the AI request with the adjusted prompt.
```

Agenda

1. Prepare

- a. Conceptualize a workflow
- b. Test your prompt and source material
- c. Choose a Provider, Get API Access
- d. Manage/Calculate Cost

- What data will be processed how in which steps?
- Does it work in a browser?
- Which provider is best for your needs?
- How can you limit and control costs?

2. Use the APIs

- a. Write requests and pass context
- b. **Extended options/features**

- How to write a simple python script which does X requests?
- **How do I set token limits, temperature, etc.?**

3. Save output for further use

- a. Output formatting
- b. Saving to data structures

- How do I tell the LLM to format output data?
- How to save the LLMs outputs to files?

4. Discussion

Extended Options / Features

These features differ from API to API

- Maximum Tokens, Temperature, Frequency Penalty, Presence Penalty
- Streaming results
- Additional media types
 - Audio
 - Other file types (PDF, ...)

Agenda

1. Prepare

- a. Conceptualize a workflow
- b. Test your prompt and source material
- c. Choose a Provider, Get API Access
- d. Manage/Calculate Cost

- What data will be processed how in which steps?
- Does it work in a browser?
- Which provider is best for your needs?
- How can you limit and control costs?

2. Use the APIs

- a. Write requests and pass context
- b. Extended options/features

- How to write a simple python script which does X requests?
- How do I set token limits, temperature, etc.?

3. Save output for further use

- a. **Output formatting**
- b. Saving to data structures

- **How do I tell the LLM to format output data?**
- How to save the LLMs outputs to files?

4. Discussion

Output Formatting

```
from pydantic import BaseModel
from openai import OpenAI

client = OpenAI()

class ResearchPaperExtraction(BaseModel):
    title: str
    authors: list[str]
    abstract: str
    keywords: list[str]

completion = client.beta.chat.completions.parse(
    model="gpt-4o-2024-08-06",
    messages=[
        {"role": "system", "content": "You are an expert at structured data extraction. You will be given unstructured text from a research paper and should convert it into the given structure},"
        {"role": "user", "content": "..."}
    ],
    response_format=ResearchPaperExtraction,
)

research_paper = completion.choices[0].message.parsed
```

Agenda

1. Prepare

- a. Conceptualize a workflow
- b. Test your prompt and source material
- c. Choose a Provider, Get API Access
- d. Manage/Calculate Cost

- What data will be processed how in which steps?
- Does it work in a browser?
- Which provider is best for your needs?
- How can you limit and control costs?

2. Use the APIs

- a. Write requests and pass context
- b. Extended options/features

- How to write a simple python script which does X requests?
- How do I set token limits, temperature, etc.?

3. Save output for further use

- a. Output formatting
- b. **Saving to data structures**

- How do I tell the LLM to format output data?
- **How to save the LLMs outputs to files?**

4. Discussion

Saving Data

```
json_string = answer_string.split("```json")[1].split("```")[0]
with open(f"page_{page_number}.json", "w") as f:
    f.write(json_string)
```

- Save as json files
- Name the files appropriately

7. Conclusions

- Creating a precise workflow is crucial.
 - Test your prompts and source materials to choose the best provider.
 - The LLMs provide programming libraries. Use them.
 - Adapt your prompts to include metadata of the presented source image.
-
- With the materials that come with this presentation, you can recreate the example or create your own workflow.
 - Be aware that all prices and ratios mentioned in this presentation are changing constantly.
